Aperiodic: Democratizing Crypto Order Flow, Liquidity & Market Microstructure Metrics

What 200+ Terabytes of Tick Data Looks Like When It's Actually Useful

MARK ARON SZULYOVSZKY AND DANIEL SZEMEREY

MAR 18, 2026

5 1 Sh

It's a big day for us: we're opening **Aperiodic** and our whole data catalog for the public.

It's been long time in the making. We've been customers to all crypto data platform and came out disappointed with the quality and variety of offering. For anyone who remotely serious trying to build quantitative strategies, you need:

- **Point-in-time** data
- Basic and advanced **liquidity metrics** (slippage, bid/ask price twap/vwap, top-the-book and deep aggregate order book liquidity)
- A large variety of **unique market microstructure metrics** that describe the st of the market well - (Run imbalance, small / larger order flow volume,
- Full exchange coverage **without survivorship bias**
- **Local-timestamped** versions of all time series

What's in it?

Over the last coupl ata to test hypotheses around ng up the whole market micr

Unlike others, Aperiodic gives you **full history for your subscription price.**

A couple of unique metrics available that's not offered elsewhere:

Deep L2 Imbalances — Bid/ask quantity imbalance aggregated across multiple orc book depths (5, 10, 20, 25 levels), rather than just the top of book.

following strategies tend to be more effective, while high entropy reflects choppy, mean-reverting conditions where directional signals break down.

Slippage — The realized cost of executing a market order against the live L1 order book.

Kyle lambda — An empirical estimate of Kyle's λ, measuring price impact per unit c signed order flow.

Large trade reversal — A metric capturing how much of the price move driven by a large aggressive trade subsequently reverts within the interval — distinguishing informed flow (which produces permanent impact) from uninformed or liquidity-dri flow (which mean-reverts).

The most convenient data interface we could imagine

Aperiodic is designed for the you: the API returns pre-signed URLs of ready-to-use parquet files that you can download with arbitrary concurrency (no rate limits), inst of an arbitrary format that you'd need to parse & figure out how to store.

We released a lightweight python wrapper **here** as well.

Download all historical data for a set of metrics for all symbols in a couple of lines code.

```
>_ pip install aperiodic
```

pypi Copy

example.py Copy

```
from datetime import date
from aperiodic import get_metrics

df = get_metrics(
    api_key="your-api-key",
    metric="flow",
    timestamp="exchange",
    interval="1h",
    exchange="binance-futures",
    symbol="perpetual-BTC-USDT:USDT",
    start_date=date(2024, 1, 1),
    end_date=date(2024, 1, 31),
)

print(df.head())
```

We also offer direct Object Store bucket access for yearly Prime subscribers.

Data infrastructure you don't have to build

The only alternative up until today to access these metrics are:

1. buy raw tick / L2 data (**very expensive**)
2. figure out a way to **store it** (could be **even more expensive**)
3. **query** it (expensive, weeks of work)
4. keep it **up-to-date** (months of work)

Paying tens of thousands of dollars in the process to cloud providers and for a sma team of experienced data engineers.

Aperiodic will get you access to these metrics so you can focus on your research & analysis from day 1, instead of spending months on data engineering pipelines.

What would you like to see next?

We maintain an collaborative, ambitious roadmap and very much welcome your feedback on the most useful additions: Aperiodic **Roadmap**.

Please shoot us a message if you have any ideas (metrics, delivery methods, etc.) you'd like to see here.

We hope Aperiodic expands your access to data that was previously out of reach; t celebrate the launch, we're offering **40% off annual subscriptions**!
