I built an intraday mark

The system runs an Av irs (WFC/AXP), with dynamic hedge ratio es

The pipeline:
→ Systematic pair sele
→ Kalman Filter with EM
→ Avellaneda-Stoikov c
→ Out-of-sample valida

Results (OOS 2024–20

- Sharpe Ratio: 1.21
- Net PnL: +$4,870 on $100K
- Max Drawdown: -2.49%
- Model active 100% of bars

The first version gave a Sharpe of -11. I found and fixed six structural bugs - from a fundamental error in which Kalman output fed the execution model, to phantom fills caused by data gaps. The final results are conservative and verified.

This project changed how I think about the gap between mathematical elegance and market reality.

Update: Several comments asked about the annualized return. The $100K is a notional reference - the inventory × spread price × 100 sha nths (~5.9% annualized). Sh

I've updated the , you can check it on the same GitHu

data. Inventory management and adverse fills are always the tricky parts to navigate in AMM. 2% annualized isn't terrible for a non co-located system, especially since most MMs really make their money off rebates which requires a relationship with the exchange
