Body text below is X's own machine translation from the Chinese original.

Over the past two weeks, BTC first fell and then surged sharply. HODL (holding strategy) rose from 612 to 733, a cumulative increase of 19.72% over the two weeks.

- Week 1 (8.09 → 8.16): 612 → 593, down 3.22%

- Week 2 (8.16 → 8.23): 593 → 733, up 23.70%

The gains were concentrated in the three days from 8.19 to 8.21, with spot price taking off from 64,681. It's now just one step away from the 80,000 integer mark. This environment is very unfriendly to options sellers, especially strategies involving selling calls. Below, we look at the performance of each strategy index.

CC35 (Covered Call)

1022 → 998 (-2.36%) → 1053 (+5.57%)

The call sold in the first week had a strike price of 65,290 and expired with 0.89% premium fully collected, so the covered call lost less than spot. In the second week, the strike price of 63,895 was breached by spot at 75,604, with payout far exceeding the premium. Thus, while spot rose 23.70%, covered call only captured 5.57%.

CLL (Collar)

790 → 768 (-2.70%) → 808 (+5.16%)

The collar strategy buys insurance on top of covered call. The put insurance over these two weeks was clearly bought for nothing, so returns were also a notch below CC35. The difference (0.34% and 0.41%) is basically the put premium.

CSP35 (Cash-Secured Put)

355 → 356 (+0.34%) → 359 (+0.93%)

The put sold in the first week was exercised, but fortunately the premium covered the payout, yielding +0.34%. In the second week, spot exploded higher, premium fully collected. Since collateral is cash, none of the second week's spot gains were captured.

WKND35 (Weekend Wide Strangle)

1475 → 1483 (+0.57%) → 1493 (+0.61%)

Although there was a sharp rise last week, it all happened on weekdays. Weekend trading remained subdued, so the weekend wide strangle steadily collected the premium.

STG35 (Weekly Wide Strangle)

246 → 248 (+0.77%) → 204 (−17.49%)

In the first week, call premium was fully collected, but the put was breached by the spot decline, giving back all premiums. Combined, the two legs eked out a small gain of 0.77%. In the second week, spot surged and breached the call. Although the put premium was fully recovered, it was far from enough to cover the call loss, causing the index to plummet 17.5%—the fifth-worst week in the past 7 years. Notably, 4 of the worst 5 weeks were during sharp rallies.

Finally, a note on the relationship between STG35 and WKND35. These two strategies use the same set of 35Δ strike rules and the same wide strangle structure; the only difference is holding period: one holds for the full week, the other just 40 hours over the weekend. Since 2020, sharp rallies and drops have almost all occurred from Monday to Friday, with weekends tending toward consolidation. Thus, the same strategy yields vastly different results.
