

Corrections Within Momentum: A Simple Robust Entry Rule

Pavel Kýček — CEO at ROBUXIO · LinkedIn post

We build our portfolios on simple, robust ideas. Example:

Corrections within momentum

1. Measure momentum.
2. Enter in correction on limit order.
3. Exit after X days.

That's it.

A few principles:

1. Stronger momentum = stronger signal.
2. Deeper correction = stronger entry.
3. Deeper corrections increase exposure to mean reversion effect.
4. Shallower corrections rely more on momentum factor.

Three conditions. Simple logic. Robust across asset classes.
