new vol estimates. mix of slow + fast ewmas. high-low combos. faster ones winning i.e.

$\sqrt{\text{ewma}(\text{diff}(\log(\text{close}), 1)^2, 10)}$. on daily data. vol estimate improvements done for now. next diving into other risk model improvements, and update frequency.. getting there..

[chart: gross vs net equity curve, net tracking gross closely]

DeltaDog @the_delta_dog · reply

maybe should say that I do realize my cost and execution assumptions is a joke when net is tracking gross like this. its just a chart..

pedma @pedma7 · reply

yeh same faster always wins. I wonder if this will always be the case so I'm considering taking the hit and just adding slower anyways. or maybe having some rolling adjustment as things mature or smth. dunno just thinking phase still

DeltaDog @the_delta_dog · reply

i kinda wanna try something fancier but doubt its worth it? happy for now at least
