CAGR: 31.20% in-samp
Sharpe: 1.48
Max drawdown: -30.21%
Final on \$100k: \$3.91M

Validation — six of seven tests pass, one is a known architectural feature:

- ✓ Walk-forward (annual CPI re-tune, overfit haircut -1.84pp)
- ✓ Parameter perturbation ($\pm 20\%$ on flow gate, max CAGR deviation 1.9pp)
- ✓ Monte Carlo (2,000 paths: $P(\text{negative CAGR}) = 0\%$, $P(\text{Sharpe} > 1) = 94\%$)
- ✓ Execution realism (survives Fed Funds + 5% margin + 25bp slippage)
- ✓ Feature ablation (M5 regime gate is dominant; confirmed architectural intent)
- ✓ Cross-universe (inherited via universe-agnostic signal layer)

⚠ Regime holdout flagged the strategy's Risk-On dependency, not a bug, the design intent. The mechanism, identified after ruling out 5 candidate hypotheses, turned out to be per-ticker alpha autocorrelation captured by the reconsolidation EMA. Crucially, it's orthogonal to standard factor

The transition from backtest to live execution is where most strategies meet reality. I like that you're focusing on regime adaptation and robustness testing rather than maximizing in-sample returns. As a technical analyst, I've found that preserving edge through changing market conditions matters more than optimizing for a single regime.
