

Update on the Majors: Moving Grid Capital Off BTC and ETH

By Steven Paterson — Systematic Derivatives Trader, Margin Syndicate · LinkedIn post

Update on the majors question.

We're moving grid capital off BTC and ETH. Not paused — moved. We will run overlay delta control on the grids to completion where possible.

The reason is structural, not performance. BTC and ETH now trade identically to ES and Nasdaq futures. Same flow, same operator behaviour, same construction: days of one-sided pressure into the short clusters, a managed topside sweep, then distribution into the chasers. Watch all four charts on the same day and you're watching one book.

That regime has a winner and a loser. Short vol gets paid — the whipsaw stays inside a managed range and theta collects. Grids get destroyed — they need independent, two-sided price action and a preconstructed program up then down fills the entire ladder on the wrong side at each turn.

So the allocation follows the structure: options carry the majors, grids trade alts. Alt perpetuals still have independent operators, idiosyncratic funding regimes and genuine two-sided volatility. That's where the system's edge lives.

We built for mean reversion. The majors stopped offering it. We're not going to argue with the tape about it.
