the components that have the least influence on the original signal through correlation analysis, which complete the filtering and noise reduction of the original signal. Then different methods are used to predict the remaining components after filtering, and the results of the prediction of each component are summed up, so as to construct the forecasting model of the RMB/USD exchange rate in this paper. The results of empirical analysis show that the average relative error of the prediction model built in this paper is 0.2124%, which can give a more accurate prediction of the RMB/USD exchange rate within two months. Subsequently, we carry on the correlation analysis of economic factors to the prediction algorithm constructed in this paper. First of all, we carefully analyze the economic indicators that affect the exchange rate, and we find that there are six factors that have a large impact on the RMB/USD exchange rate, which are foreign exchange reserves, import and export balance, current year-on-year growth rate of industrial added value GI, money supply, consumer price index CPI, and inflation rate. Secondly, using vector autoregression (VAR), we establish the economic correlation between these six factors and each intrinsic
